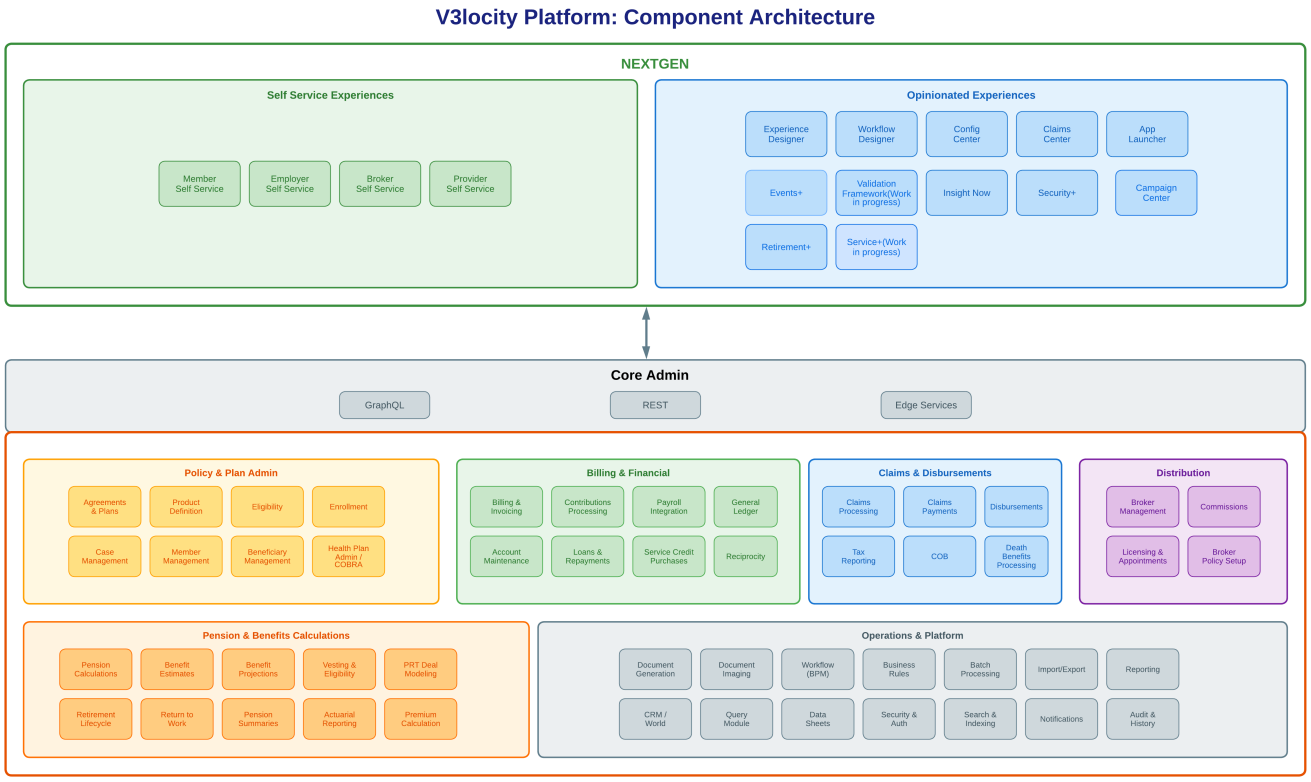
V3locity Platform: Architecture Component Map

Platform Overview



Summary

- V3locity delivers outcomes through two layers: Core Admin (domain system of record) and NextGen (modern digital experiences & platform services).
- The layers are connected through a shared API Fabric (REST, GraphQL, Edge services) so every capability can be consumed without duplicating business logic.

How to Read the Diagram

1. Green band (NextGen) – experience layer and modern platform services.
2. Gray band (API Fabric) – contract surface between the two layers.
3. Orange band (Core Admin) – domain engines, operations, and calculations.

NextGen Layer (Green)

- Self-Service Experiences: Member, Employer, Broker, Provider portals built with Experience Designer and consuming the API fabric.
- Opinionated Experiences: Productized admin and operations apps (Config Center, Claims Center, App Launcher, etc.) plus shared accelerators such as Events+, Validation Framework, Service+, Security+, Retirement+, Campaign Center, Insight Now.
- Responsibilities:
    - Deliver all new UX, persona portals, and admin consoles.
    - Host low-code tools (Experience & Workflow Designers) and “+” services.
    - Orchestrate by calling REST/GraphQL or Edge services, never bypassing APIs.

API Fabric (Gray)

- REST/GraphQL: System APIs emitted by Core; consumed by NextGen, partners, and edge services.
- Edge Services: Wizards, composite endpoints.

Core Admin Layer (Orange)

- Policy & Plan Admin: Agreements, products, eligibility, enrollment, case & member management, COBRA.
- Pension & Benefits Calculations: Actuarial engines, projections, retirement lifecycle, PRT modeling, premium calc.
- Billing & Financial: Billing, contributions, payroll, GL, loans, service credit, reciprocity.
- Claims & Disbursements: Claims processing, payments, disbursements, tax, COB, death benefits.
- Distribution: Broker management, licensing/appointments, policy setup, commissions.
- Operations & Platform: Documents, imaging, workflow engine, business rules, batch/data ingestion, CRM/ World, query module, data sheets, security/auth, search/indexing, notifications, audit/reporting.
- Responsibilities:
    - Remain the authoritative source for domain data, transactions, and compliance logic.
    - Publish APIs through the fabric; no direct UI work other than legacy back-office needs.
