Query module and Document creation

Create View and Sub view (sub view if required) then run an commit them in working instance.

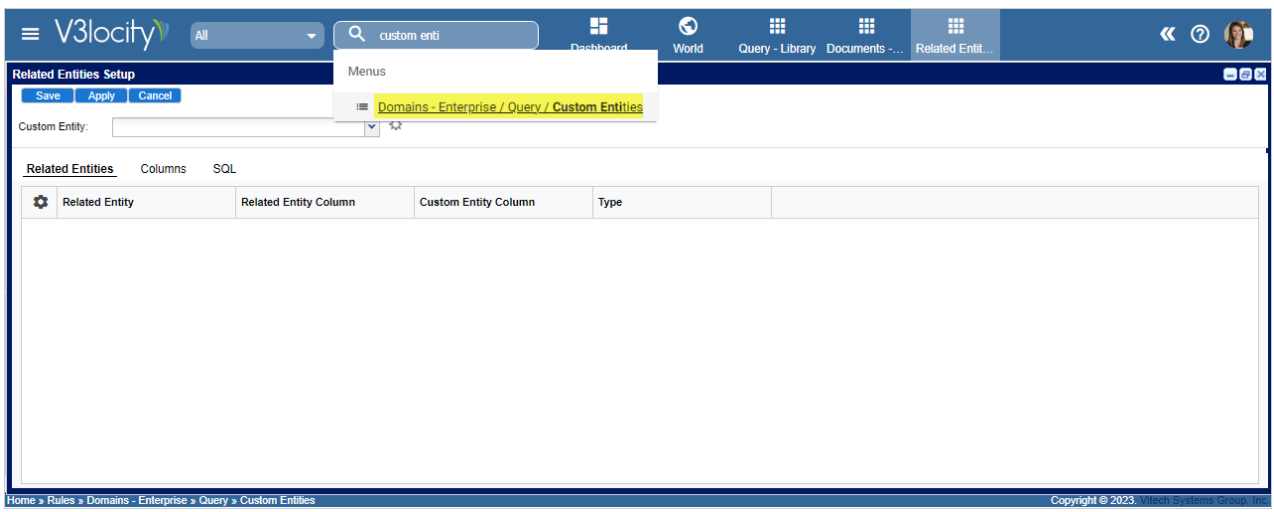
```
*<azpsprsdev> Script-16   *<azpsprsdev> Script-9   *<azpsprsdev> Script-10
end;
$$ language plpgsql;
do $$
begin
   update dbo.entity_attribute set query_visible='Y',visible_flag='Y'
where entity_id=pkg_benefit_s.f_get_entity_id('V_EMP_SES_REG_CONFIRM_EMAIL_DQ');
end;
$$ language plpgsql;
do $$
begin

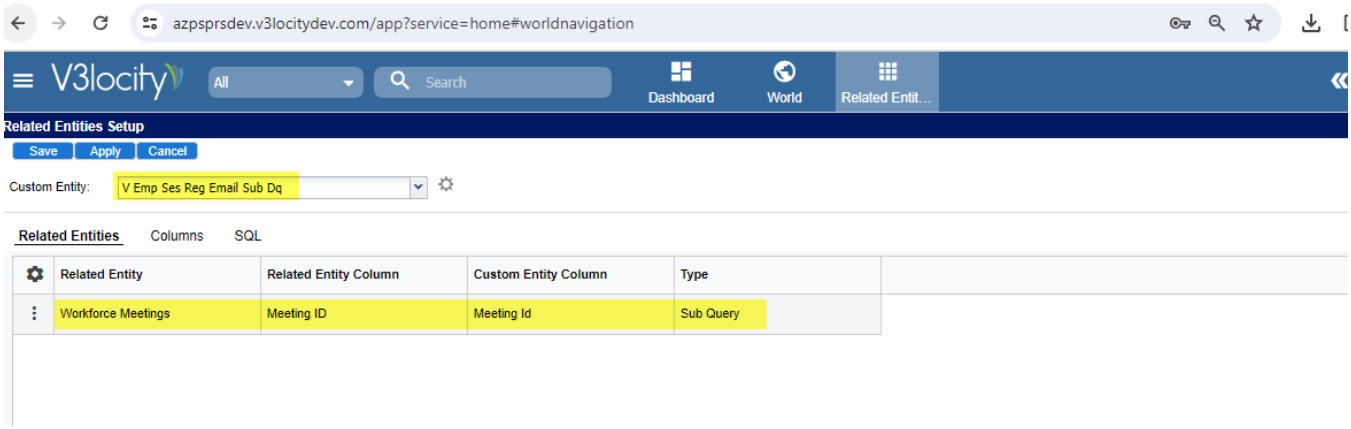
  perform Pkg_Util_query.p_update_joins(piv_prime_entity_name => 'V310_MEETING',
                                        piv_second_entity_name => 'V_EMP_SES_REG_CONFIRM_EMAIL_DQ',
                                        pin_seq_no => 1,
                                        piv_join_expression => NULL,
                                        piv_operator => '=',
                                        piv_left_attribute_name => 'MEETING_ID',
                                        piv_left_entity_name => 'V_EMP_SES_REG_CONFIRM_EMAIL_DQ',
                                        piv_right_attribute_name => 'MEETING_ID',
                                        piv_right_entity_name => 'V310_MEETING',
                                        piv_show_as_subquery => 'N'
                                        );

end;
$$;
```

```
*<azpsprsdev> Script-16   *<azpsprsdev> Script-9   *<azpsprsdev> Script-10
create or replace view CLIENT.V_EMP_SES_REG_EMAIL_SUB_DQ as
SELECT e.employer_name,
    trunc(me.start_date) AS date_of_event,
    to_char(me.start_date, 'HH12:MI AM'::text) AS time_of_event,
    ( SELECT v.description
```

Go to Custom entities in UI and create a related entity. (only if sub query present)

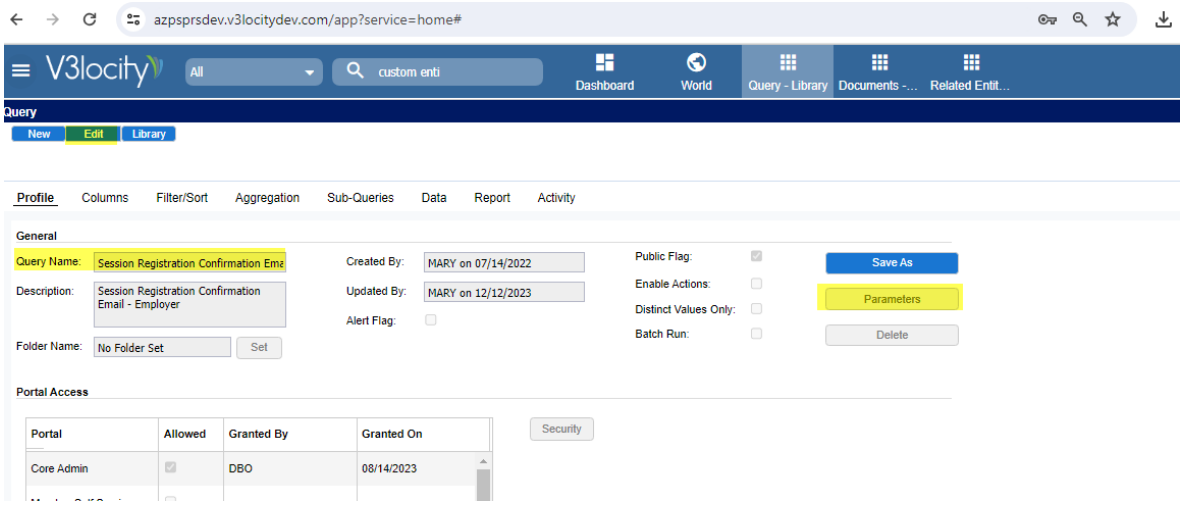




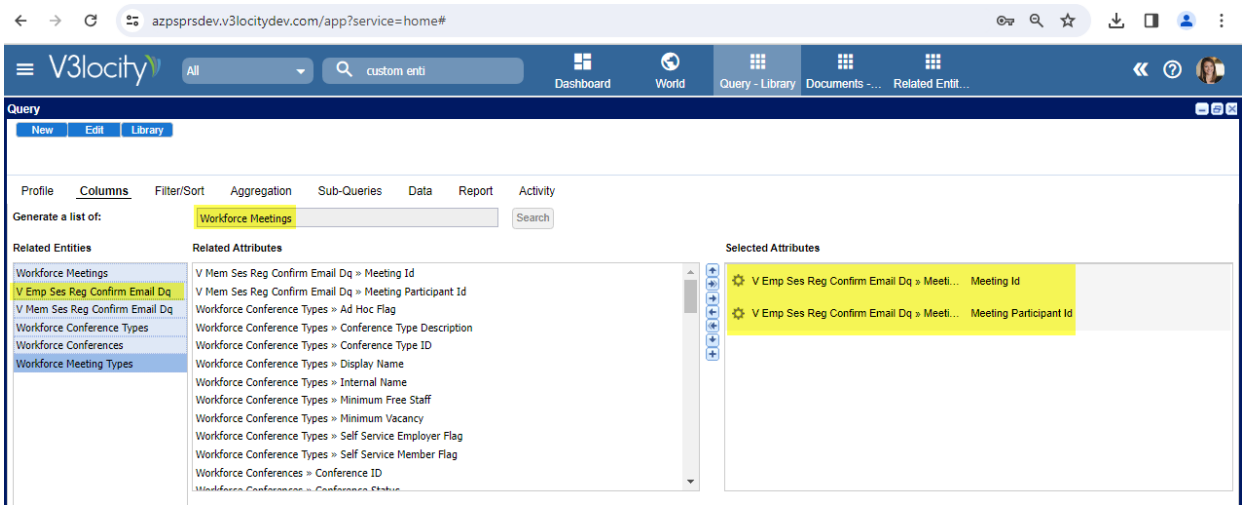
Query module creation :

Create a new query in Query module.

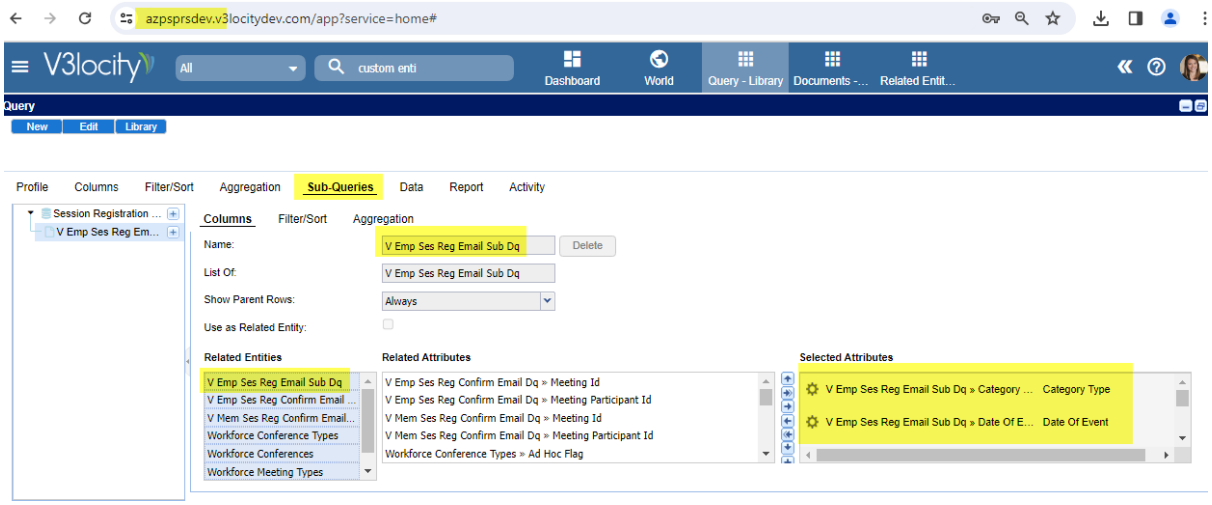
Create a parameter to filter the record (if required)



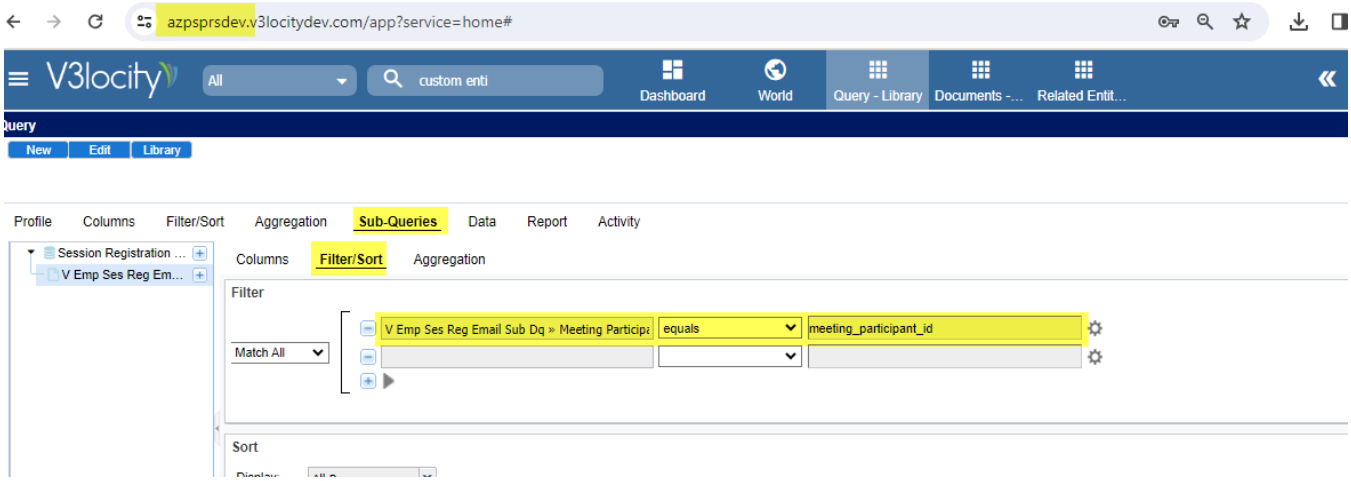
Select the required attributes from related attributes.



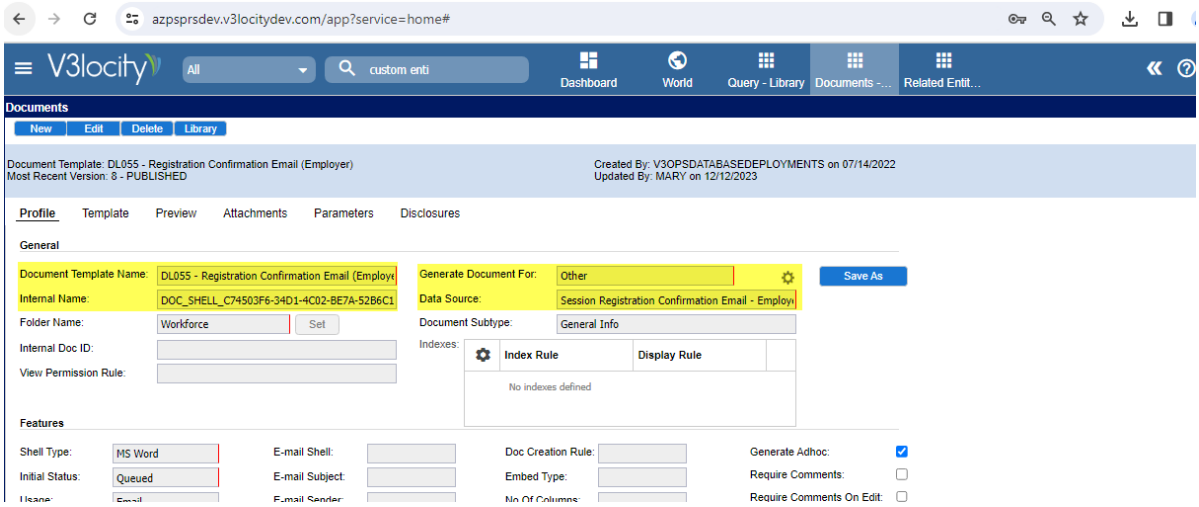
Use the created related entity (sub query) under sub queries part. (only if sub query created)



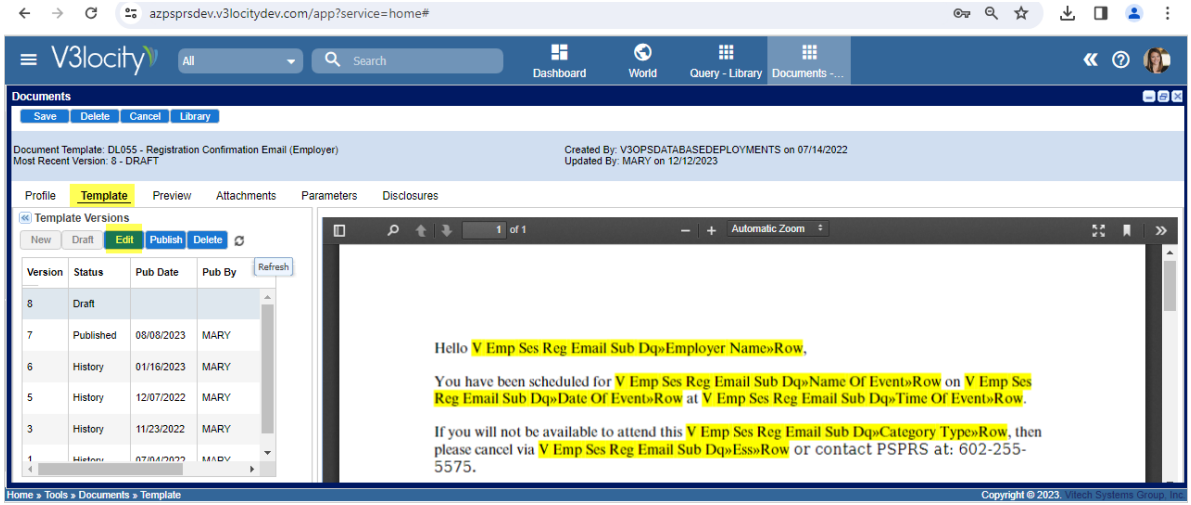
Use filter condition. (only if sub query and parameter created)



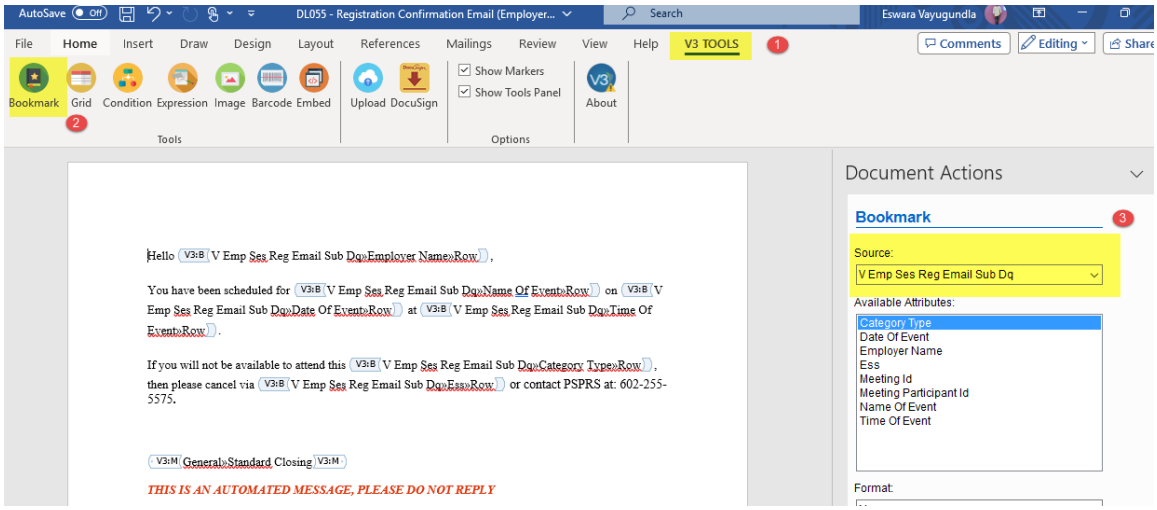
Use the created query module for the document under data source.



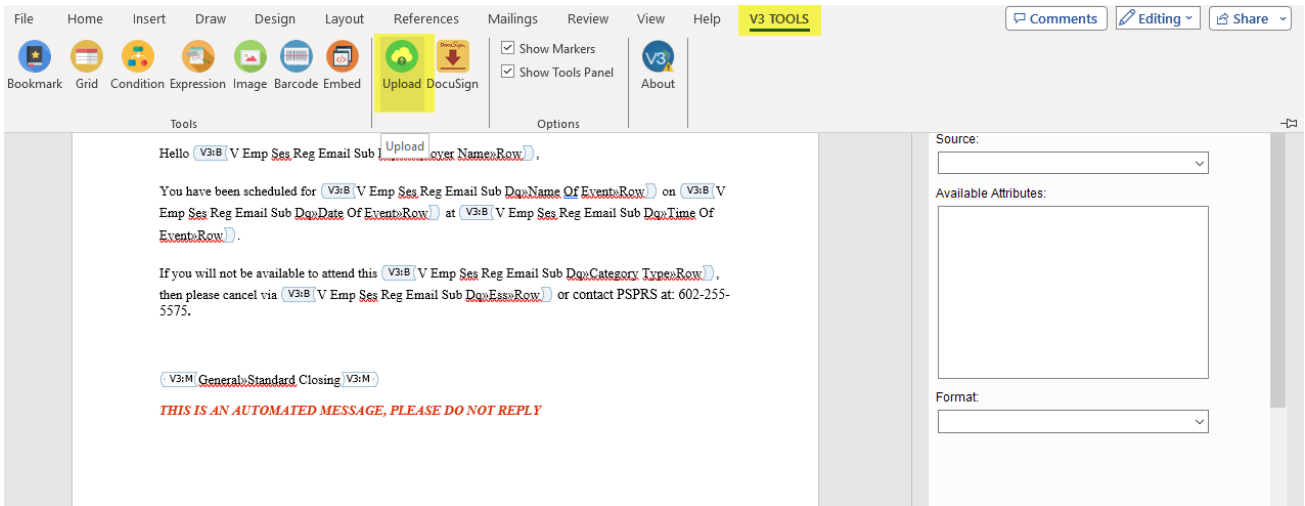
Click on Edit >> template >> Edit under template section.

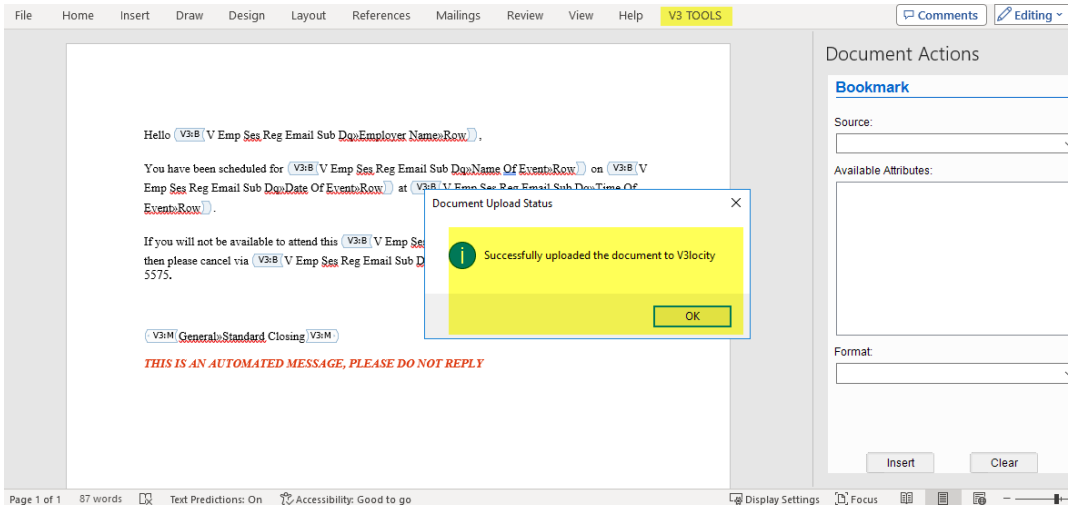


Open the downloaded word document and configure the bookmarks.

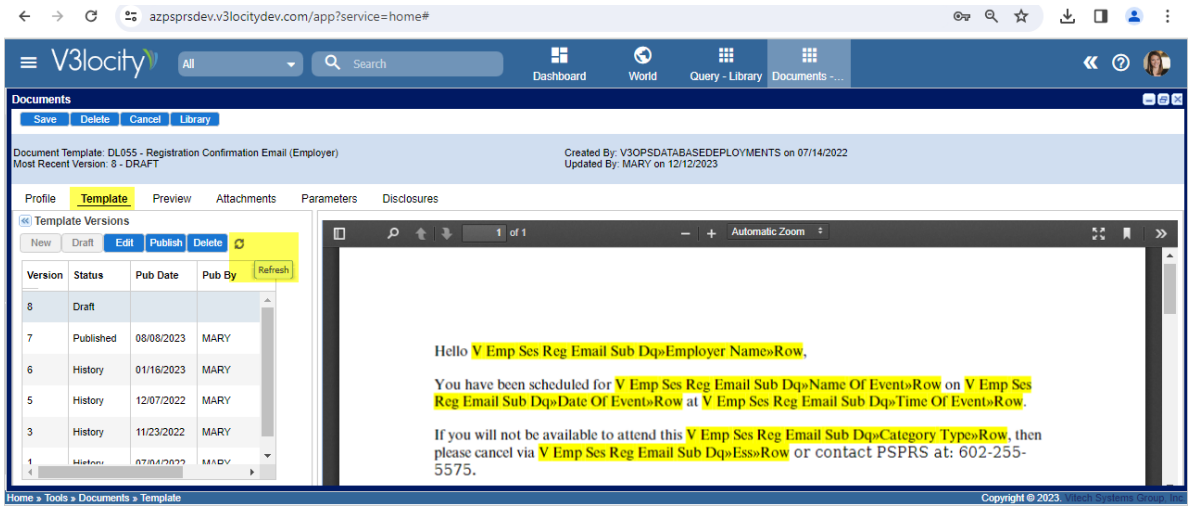


After configuration of bookmarks, upload the document.

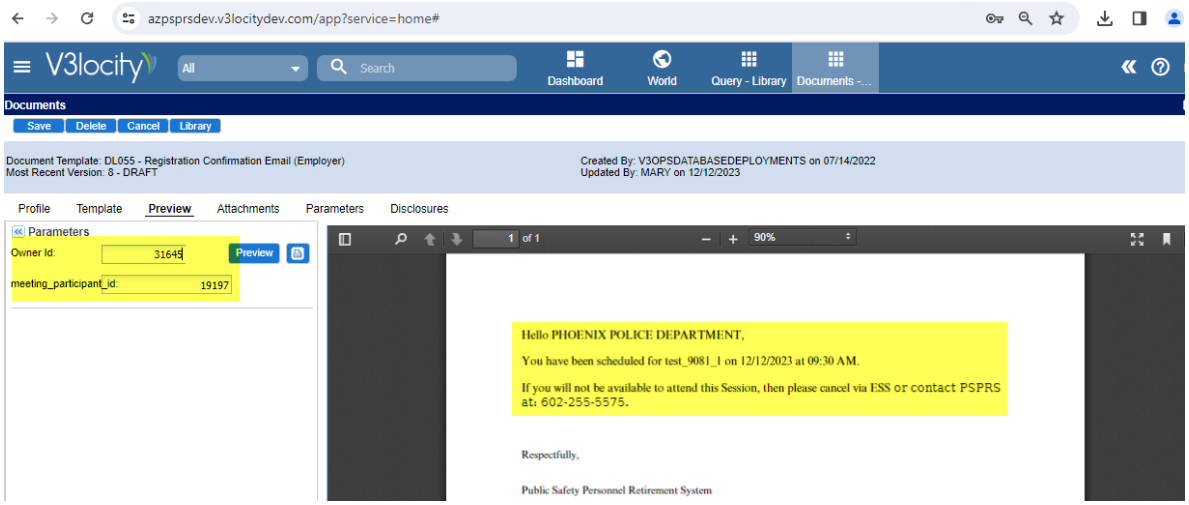




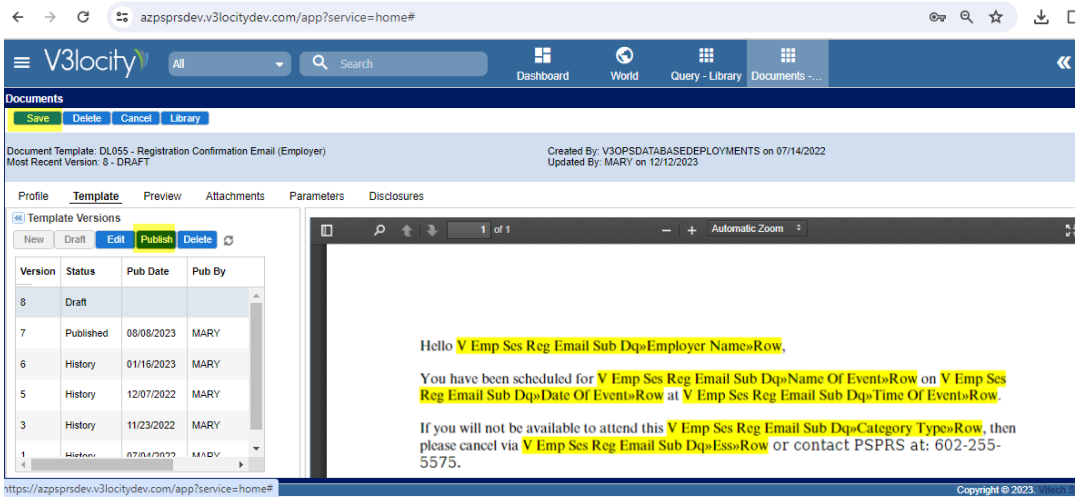
After uploading go to template section >> click refresh.

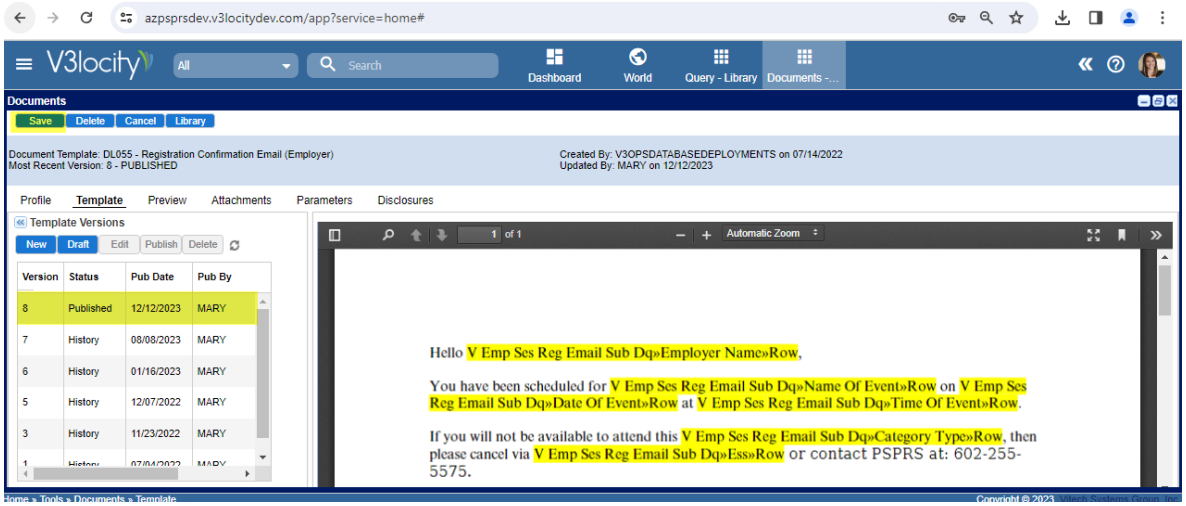


Go to preview section >> give the valid parameters and verify the bookmarks.



Once the bookmarks values are retrieving as expected go back to template section >> publish the current version >> save the document.



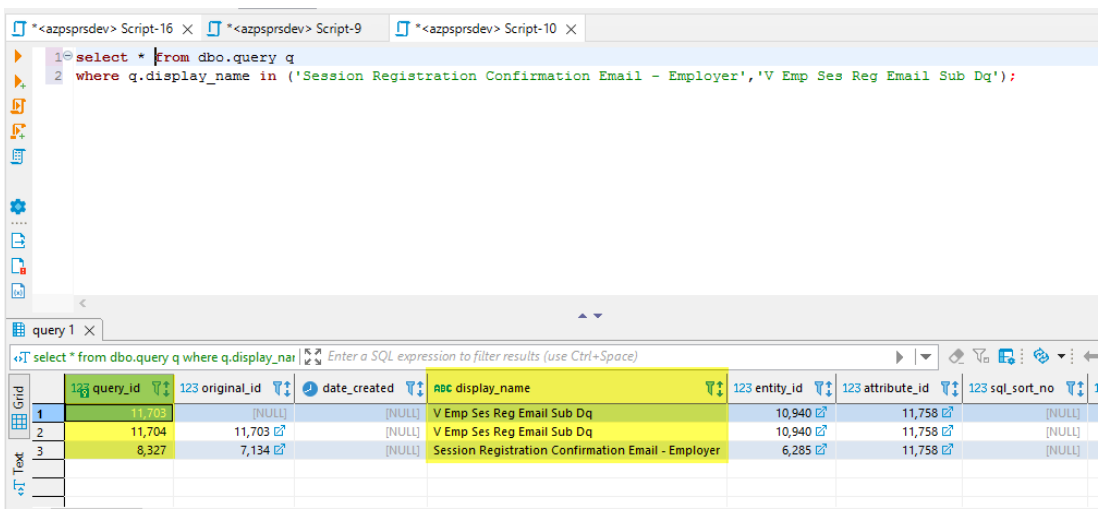


<u>Extraction Part :</u>

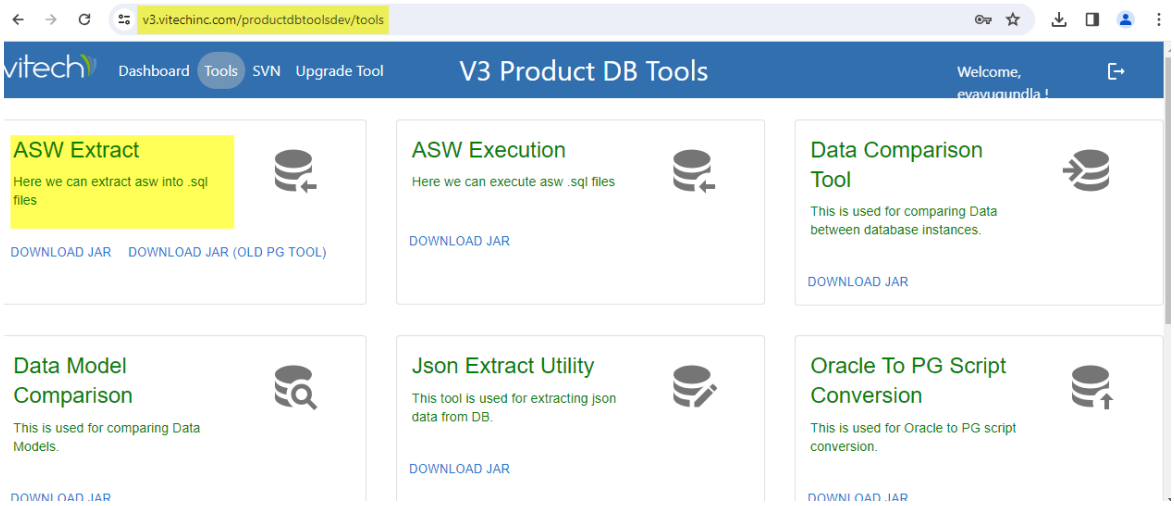
<u>Query module extraction :</u>

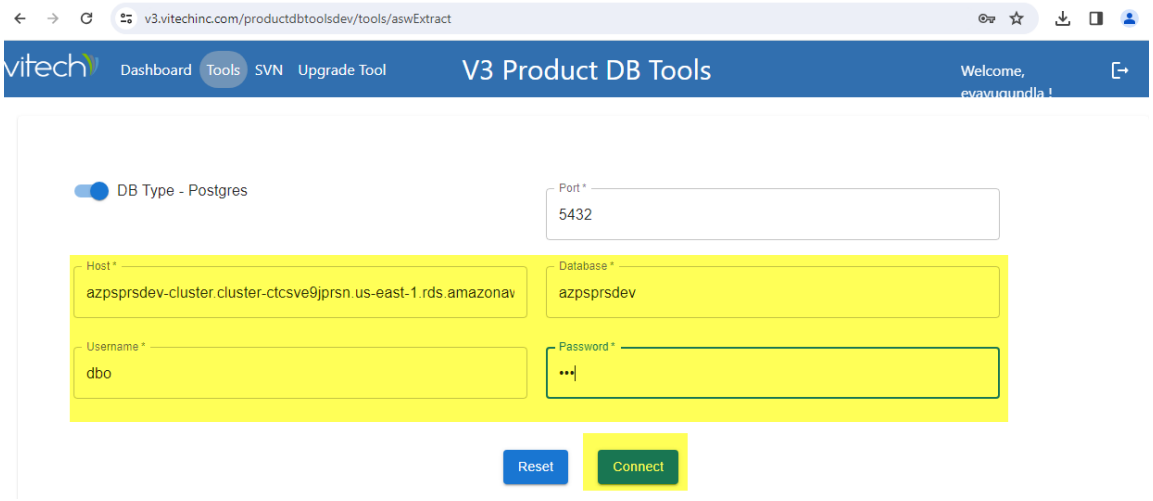
Extract the Created Query module. (extract sub query if created)

We need to extract sub query first and then main query. (If sub query is not created, extract only main query)

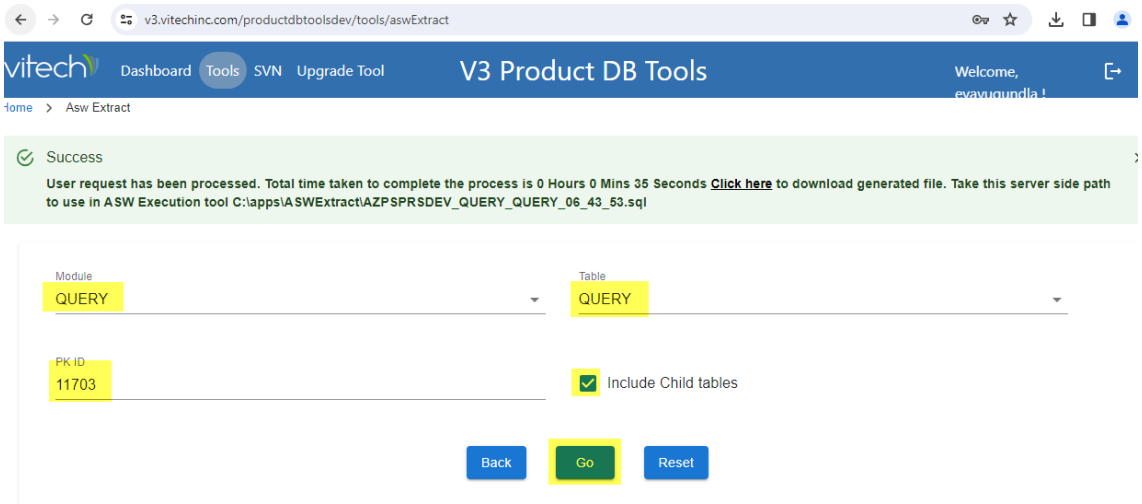


Use product extraction tool for extraction and provide necessary details.

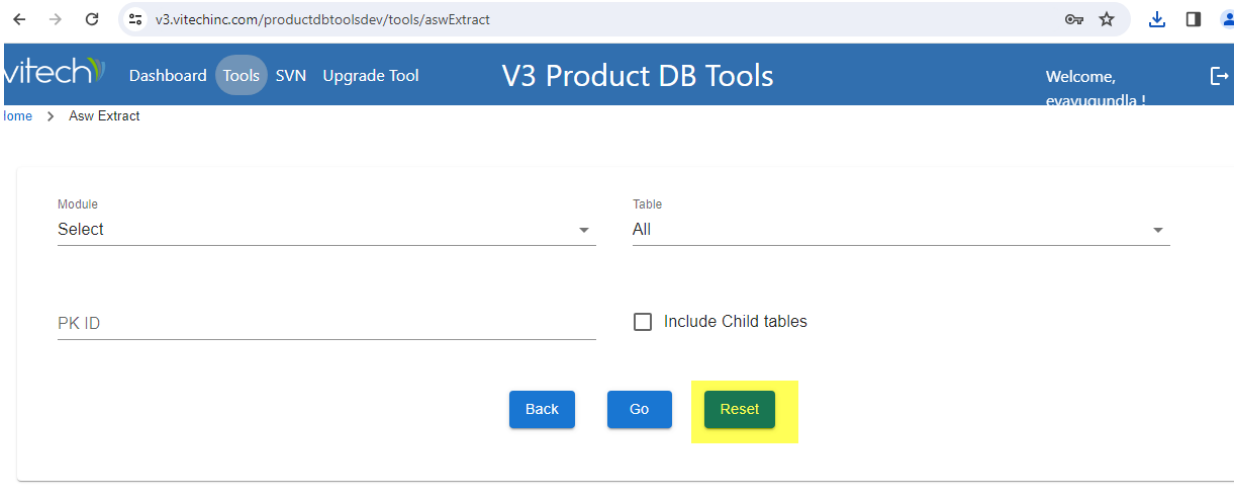




Give the details to extract Query >> Click 'Go'



Once the extraction complete Click 'Reset' and again provide the details for next Query extraction.



<u>Document template extraction :</u>

*<azpsprsdev> Script-16 | *<azpsprsdev> Script-9 | *<azpsprsdev> Script-10

```
select * from dbo.query q
where q.display_name in ('Session Registration Confirmation Email - Employer','V Emp Ses Reg Email Sub Dq');

select ds.doc_shell_id ,ds.current_version ,ds.version_number, ds.doc_shell_display_name, ds.*
from dbo.doc_shell ds
where ds.doc_shell_display_name = 'DL055 - Registration Confirmation Email (Employer)'
and ds.current_version = 'Y';
```

doc_shell 1

select ds.doc_shell_id ,ds.current_version ,ds.v | Enter a SQL expression to filter results (use Ctrl+Space)

	doc_shell_id	current_version	version_number	doc_shell_display_name	doc_shell_id	doc_shell_name
1	13,793	Y	8	DL055 - Registration Confirmation Email (Employer)	13,793	DOC_SHELL_C74503F6-34D1-4(
